

Course 3 End-of-course project overview: Google Fiber

It's time to complete the final part of your end-of-course project! So far, you have been working with fictional data provided by the Google Fiber team to showcase your business intelligence skills as part of the interview process. You joined tables that included key metrics necessary for a visualization and generated a reporting table to be imported to Tableau. For an example of the type of target table you need for the end-of-course project, refer to [the previous course's end-of-course project exemplar](#).

Now, use the target table you created to design a BI visualization that will address the Google Fiber customer service team's questions. As you create your dashboard, complete the steps of the process you've learned in this course. Start by creating a mockup, then make your charts, a dashboard, and a brief presentation that summarizes your work. At any time, feel free to review the activities from earlier in this course.

When finished, you will have a complete BI project that you can incorporate into your portfolio. This will help you demonstrate the skills you've learned in this certificate program to potential employers.

Good luck on the last step of your end-of-course project!
